

DATA SHEET

KEY BENEFITS

Reliability

VeriSign owns and operates a proprietary toll-free platform which ensures greater reliability than a third-party source and provides access to every 800 number in the United States and Canada. VeriSign also operates the largest independent SS7 network in the world—enabling greater link diversity and reducing the points of potential network failure.

Flexible Service Offering

Our proprietary application allows for flexibility in data loading and reporting, including monthly electronic 11-50-86 data files to use with your Carrier Access Billing System (CABS) for cost recovery. Toll-Free Database Services are accessible via traditional SS7 or Signaling Transport (SIGTRAN) protocols, allowing for a cost-effective IP-based connectivity option.

Full Solutions Provider

VeriSign is a single-source provider of a full range of intelligent network and database services, including SS7 connectivity (ISDN User Part [ISUP] and Transaction Capabilities Application Part [TCAP] services), calling name (CNAM) and Line Information Data Base (LIDB) services, toll-free database services and Number Portability.

VeriSign® Toll-Free Database Services

VeriSign® Toll-Free Database Services enables you to tap into the large toll-free market while delivering top quality service to your subscribers. With VeriSign you have a provider who can offer a full range of connectivity and database services and give you access to every toll-free number in the United States and Canada.

+ The VeriSign Difference

At VeriSign, we own and operate our own toll-free platform (rather than using a third party), which ensures greater reliability. We also operate the largest independent Signaling System 7 (SS7) network in the world—which provides greater link diversity and reduces the points of potential network failure. You can trust that our Toll-Free Database Services will connect toll-free subscriber calls seamlessly and swiftly.

+ Toll-Free Database Services in Action

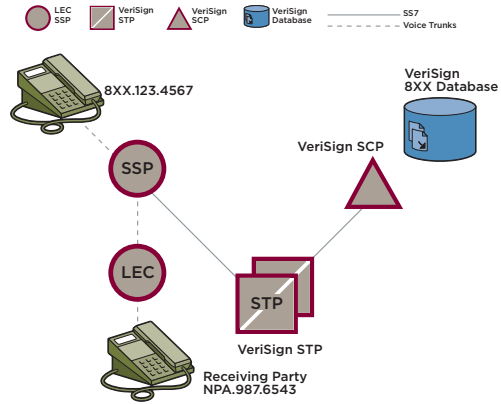

When a consumer calls a toll-free number from your area:

- Your switch receives the call and launches a query over the VeriSign SS7 network.
- The VeriSign network routes the query to Toll-Free Database Services and identifies the appropriate carrier for the call, and other routing information as needed.
- The VeriSign network returns the response to your Service Switching Point (SSP) for correct call routing.
- VeriSign offers an electronic monthly 11-50-86 data file that provides customers with a breakdown of query counts by long-distance providers.

Where it all comes together.™
